

Real archival spectra: twelve nominal Fe II windows

UVES SQUAD DR1 · native pixels and published statistical errors · no model fit or injected signal

HE 0515–4414 | $z_{\text{abs}} = 1.1508$

Q0347–3819 | $z_{\text{abs}} = 3.025$

— Observed normalized flux Published flux $\pm 1\sigma$ statistical error - - - Nominal absorber redshift

C/N = median($1 / \text{normalized error}$), per 1.3 km/s pixel; it is not a fitted line-position precision.

No telluric/blend correction is applied here. The high- z windows near 1.04 μm have $C/N \approx 1\text{--}2$ and are poor precision candidates.
